Life is Full of passwords

By: Ben Emata

It has been said that the world has been in existence for several million of years. Except for recovered artifacts, signs, important basis and speculations, no one have ever had the chance to prove such contention. Others claim it has been moving for nearly a billion years. Things like these remains in the hazy shadows of doubts. Very cloudy and generations come and go without anything concrete on this age-old bewilderment.

Legends had it that there were lots of living creatures, which had roamed the world for a long time but now had been extinct. Take the case of the dinosaurs that purportedly lorded it out on the surface of the plant. The tales about their appearance and banishment remain puzzles to the scientists in the present day. It seems the world we are in, is filled with doubts and uncertainties. The reason could be that man exists very much later than these creatures and other things around the planet. Our comprehension, therefore, on this regard is either too little or very limited. Or it might be that it is not for man to explore. Our intelligence after all has limitations.

It seems there is something that we need to open into the windows of long ago. In the world of modern day technologies, we need passwords to open those moments in the past. But unlike this scenario, the latest in learning and studies by man do not show anything about the days prior to our intelligence. It is, therefore, very discouraging and even self-defeating to even think of matters that never had been brought to us before. In other words, man's pre-existence.

The quest for knowledge of the past will surely help us determine our studies for the future. But unlike the fiction stories that do not need much ideas in

the past, our desire to know them will lead us to determine many things on Earth.

Man’s scientific study over the centuries is pursued unrelentlessly by determined archaeologists. They make excavations and/or diggings everywhere in the world especially in known ancient cities and villages hoping to recover relics, artifacts or anything. These people travel worldwide in pursuit of what knowledge they may discover from the footsteps of the ages. Trying hard to find what remains of the past that has historic interest because of its age and association with time.

A lot of artifacts have been unearthed already ever since this study began. And surely enough scientists were able reach nearer to the missing links that existed in wide gaps for ages. With all those human bones on hand, it is not too far that they will be able to determine, at least, the early community and culture of man.

These ventures have led us to the so-called man’s evolution. They discovered lost cities and have amazingly and initially studied the life and behavior of the early man. Comparing with today’s modern lifestyle, science is working well with modern technology.

For instance, the latest discovery of the evolution of man collides with Darwin’s theory that we came from the apes. Scientists used to think Homo sapiens evolved from Neanderthals. It has been established later that we did not come from Neanderthals but the two species lived in the same time period.

Our scientists are very anxious to showcase in the modern times the real story of the past to enable man to proceed to the future. But why are we interested of our past? To put us in the right perspective insofar as our desire to move to the future?

Study of history has always been very interesting to every one of us. This is the reason why in our early learning in school, there offered to us history books from many nations, sciences, and many things that just fit our like and

interests. And these histories of all sorts have helped us a lot in our daily existence. They may contribute one way or another to the truth of our past.

Man needs the truth about him and his past to enable him to forestall his direction in the future. Human intelligence!
